Integrated Network Solutions GateConnect™ Service

Integrated Network Solutions GateConnect service is the first managed solution specifically designed for the O&G gate location. Gate management companies, land owners, and energy companies will appreciate the comprehensive and necessary bundle of features required to connect their remote gate location to the rest of the world for safety, security and productivity.

Standard Features

- **Megapixel Video** – remote access viewing from anywhere, automated event recording
- **VOIP Telephone Service** – Unlimited long distance calling anywhere in CONUS
- **Internet Access** – Wireless Access for the entire gate location – indoor and out
- **24x7 Remote Management & Monitoring**
- **Options:** Thermal video, Stand-alone solar, VSAT, Cordless VOIP phones, Automated Gate Control, Long term cloud video storage

GateConnect™

Service Description

Remote Connectivity

The GateConnect™ service is delivered to the gate location via 4G LTE service widely available in most areas no matter how remote. Maximum signal levels and availability are ensured through INSI's Multi-antenna solution mounted on the provided telescopic mast. The cellular router is the gateway in which all GateConnect™ services are securely transported. For the few remote locations not covered by a cellular service provider, INSI is happy to provide a low-cost VSAT solution to provide the same bundle.

Megapixel Video

The GateConnect™ service provides remote situational awareness of the gate location to any authorized viewer through the use of enterprise level 6MP video sensors. All activities at the gate location are automatically triggered and stored in dual locations for secure and guaranteed future documentation. Automated notifications and e-mails can be generated as customer requirements demand, to include video clips or story-board imagery of recorded events. Optional thermal video sensors as well as License Plate Recognition (LPR) capabilities are available.

Voice Over IP (VOIP) Telephone

The GateConnect™ service includes a single VOIP desktop telephone with a number originating from any area code (Houston numbers standard) and unlimited long distance calling to anywhere in the continental USA. Voice-mail, call-waiting and speakerphone are standard features. Optional cordless VOIP handsets and additional, multiple lines are available.

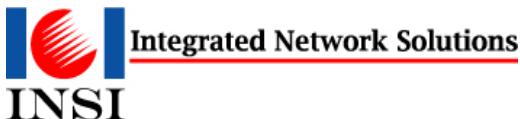

Internet Access

The GateConnect™ service includes lightning fast internet broadcast wirelessly to the gate location and surrounding area with multiple 802.11g antennas. Internet filtering based on a customer usage policy ensures unauthorized websites are not accessible and company resources are not wasted.

Multiple SSID's can be provisioned to provide multiple variable service and speed levels to different user groups. Moves, Adds and Changes all can be accommodated easily and quickly by simply contacting the INSI customer support center.

Designed for Reliability

The gateway hardware and wireless system is designed to ensure maximum signal through the use of multiple antennas, installed at elevation for clear line of sight. The entire system is power protected with an industrial generator-tolerant uninterruptible power supply (UPS).
