SafetyConnect™

Service Description

Remote Connectivity

The SafetyConnect™ service is delivered to your location via 4G LTE service widely available in most areas no matter how remote. Maximum signal levels and availability are ensured through INSI's Multi-antenna solution mounted on the provided telescopic mast. The cellular router is the gateway in which all SafetyConnect™ services are securely transported. For the few remote locations not covered by a cellular service provider, INSI is happy to provide a low-cost VSAT solution to provide the same bundled service.

Megapixel Video

The SafetyConnect™ service provides remote situational awareness of the site to any authorized viewer through the use of enterprise level 5MP video sensors. All recorded activities at the well location are automatically triggered and stored in dual locations for secure and guaranteed future documentation. Automated notifications and e-mails can be generated as customer requirements demand, to include video clips or story-board imagery of recorded events. Optional thermal video sensors as well as License Plate Recognition (LPR) capabilities are available

Voice Over IP (VOIP) Telephone

The SafetyConnect™ service includes a single VOIP desktop telephone with a number originating from any area code (Houston numbers standard) and unlimited long distance calling to anywhere in the continental USA. Voice-mail, call-waiting and speakerphone are standard features. Optional cordless VOIP handhelds, E911 service and additional, multiple lines are available.

Internet Access

The SafetyConnect™ service includes lightning fast internet broadcast wirelessly to the gate location and surrounding area with multiple 802.11g antennas. Internet filtering based on a customer usage policy ensures unauthorized websites are not accessible and company resources are not wasted. Multiple SSID's can be provisioned to provide multiple variable service and speed levels to different user groups. Moves, Adds, and Changes all can be accommodated easily and quickly by simply contacting the INSI customer support center.

Designed for Reliability

The battery plant, gateway hardware and wireless system are designed for and proven to provide a dependable and lasting service that will survive in the rugged environment and harsh weather conditions that remote location technology components are exposed to.
